Implement tictactoe game

Algorithm

- * Create an 2-dimensional array and the all its initialised with Space " " and to represent the empty cell.
- * Then Create a function print-board to create 3×3 dimension board.
- * The function check-winner is created to check the winner ; then check the row, columns and diagonals to get or to find out the winner. If no winner found return None.
- * The function is-board-full to check the board is full or not to evaluate the tie condition.
- * The main function tictactoe() is used to call the functions initialize board() and current player it taken at 'x'.
- * Now Check the input with condition of $\text{row} < 0$ or $\text{row} > 2$ or $\text{col} < 0$ or $\text{col} > 2$ or $\text{board}[\text{row}][\text{col}] != '-'$ for invalid input.
- * Therefore, with proper input continue with the game to get the output winner or tie.

Q1.6
24.9.24

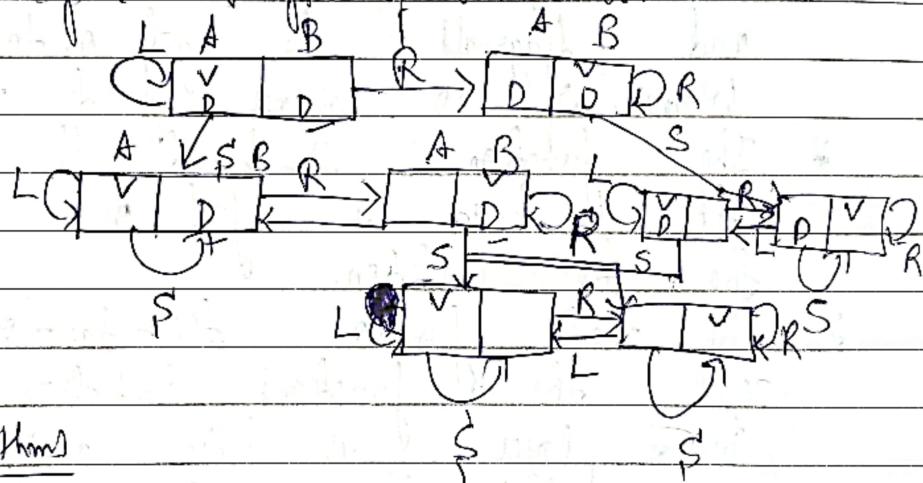

Implement Vacuum world cleaner.

Pseudo code:

function REFLEX → VACUUM-AGENT([location, status])
returns an action.

if Status = Dirty then return Suck.
else if location = A then return Right.
else if location = B then return Left.

State-Space Diagram of Vacuum World.

* Algorithms

- * The function implemented in the clean, print-R and the main function.
- * The main function contains the floor list where the user enters the row and columns.
- * If pseudo code '1' at dirty and '0' at clean.
- * In the clean function it contains row, col and the even row floor from left to right and add row.

- iterates through right to left.
- * The point contains or updates each iteration and evaluate the status and each operation or action.
 - * Also the 'i' is changed to '0' and goal is achieved.

Lab - 2

Solve 8 puzzle problem using DFS and BFS

F

1. Problem Representation-

State Represent the state of the puzzle as a 3×3 grid or a one-dimensional array.

Goal State Define the target arrangement as:

1	2	3
4	5	6
7	8	-

2. Common Components

Function to generate Successor Create a function that produces all valid states that can be reached from the current state by moving the blank tile/ space tile to left, right, up, down.

3. Successor Generation &

function generateSuccessor(state)

Find the position of the blank tile/ Space tile.

Generate new states by swapping the blank tile with adjacent tiles (up, down, left, right) if the moves are valid.

Now, the tracing is done by the above approach to generate the goal state from the above "Actions", where start state example like and goal state like,

1	2	3

For 8 Puzzle problem and Implementing the
Solve A* Search problem using misplaced tiles and
manhattan Distance for calculating f(n) using both

a) $g(n)$ = depth of a node

b) $h(n)$ = heuristic value

no. of misplaced tiles.

$$f(n) = g(n) + h(n).$$

c) $g(n)$ = depth of a node

$h(n)$ = heuristic value

manhattan distance.

$f(n) = g(n) + h(n)$. Find the best cost effective method for this problem.

Algorithm for A* Search :-

Step 1 :- place the starting node in the open list.

Step 2 :- check if the open list is empty or not.

If the list is empty return failure and stop.

Step 3 :- Select the node from the open list which has the smallest value of evaluation function ($g + h$). If node n is goal node then return success and stop. Otherwise

Step 4 :- Expand node n and generate all of its successors and put it in the closed list. For each successor 'n', check whether n is already in open or closed list. If not then complete evaluation function for n and place into open list.

Step 5 :- else if node n is already in open and closed, then it should be attached to the back pointer which reflects the lowest g(n) value.

Step 6 :- At the last, after the iteration return to the Step 1.

Final State/goal State

Solution:

Lab - 8(a)

Tol 8 puzzle problem and solving using Iterative Deepening approach (Search).

Algorithm

1. For each child of the current node.
2. If it is the target node, return.
3. If the current maximum depth is reached, return.
4. Set the current node to this node and go back to 1.
5. After having gone through all children, go to the next child of the parent (the next sibling).
6. After having gone through all children of the start node, increase the maximum depth and go back to 1.
7. If we have reached all leaf (bottom) nodes, the goal node doesn't exist.

function Iterative_Deepening_Search(problem) returns a solution or failure

for depth = 0 to do

result ← Depth-Limited-Search(problem,
depth)

If result ≠ cutoff then return result.

Lab - 4(b)

Implement Hill climbing Search algorithm to solve N-Queens problem.

function HILL-CLIMBING(problem) return a state that is a local maximum.

current ← Make-Node(problem, initial-state).

loop do

 neighbor ← a highest-valued successor of current.

 if neighbor.Value < current.Value then
 return current.State

 current ← neighbor

problem formulation

* State: 4 queens on the board. One queen per column.

— Variables: v_1, v_2, v_3, v_4 where v_i is the row position of the queen in column i . Assume that there is one queen per column.

— Domain for each variable: $v_i \in \{0, 1, 2, 3\}$ b/w.

* Initial State: a random state.

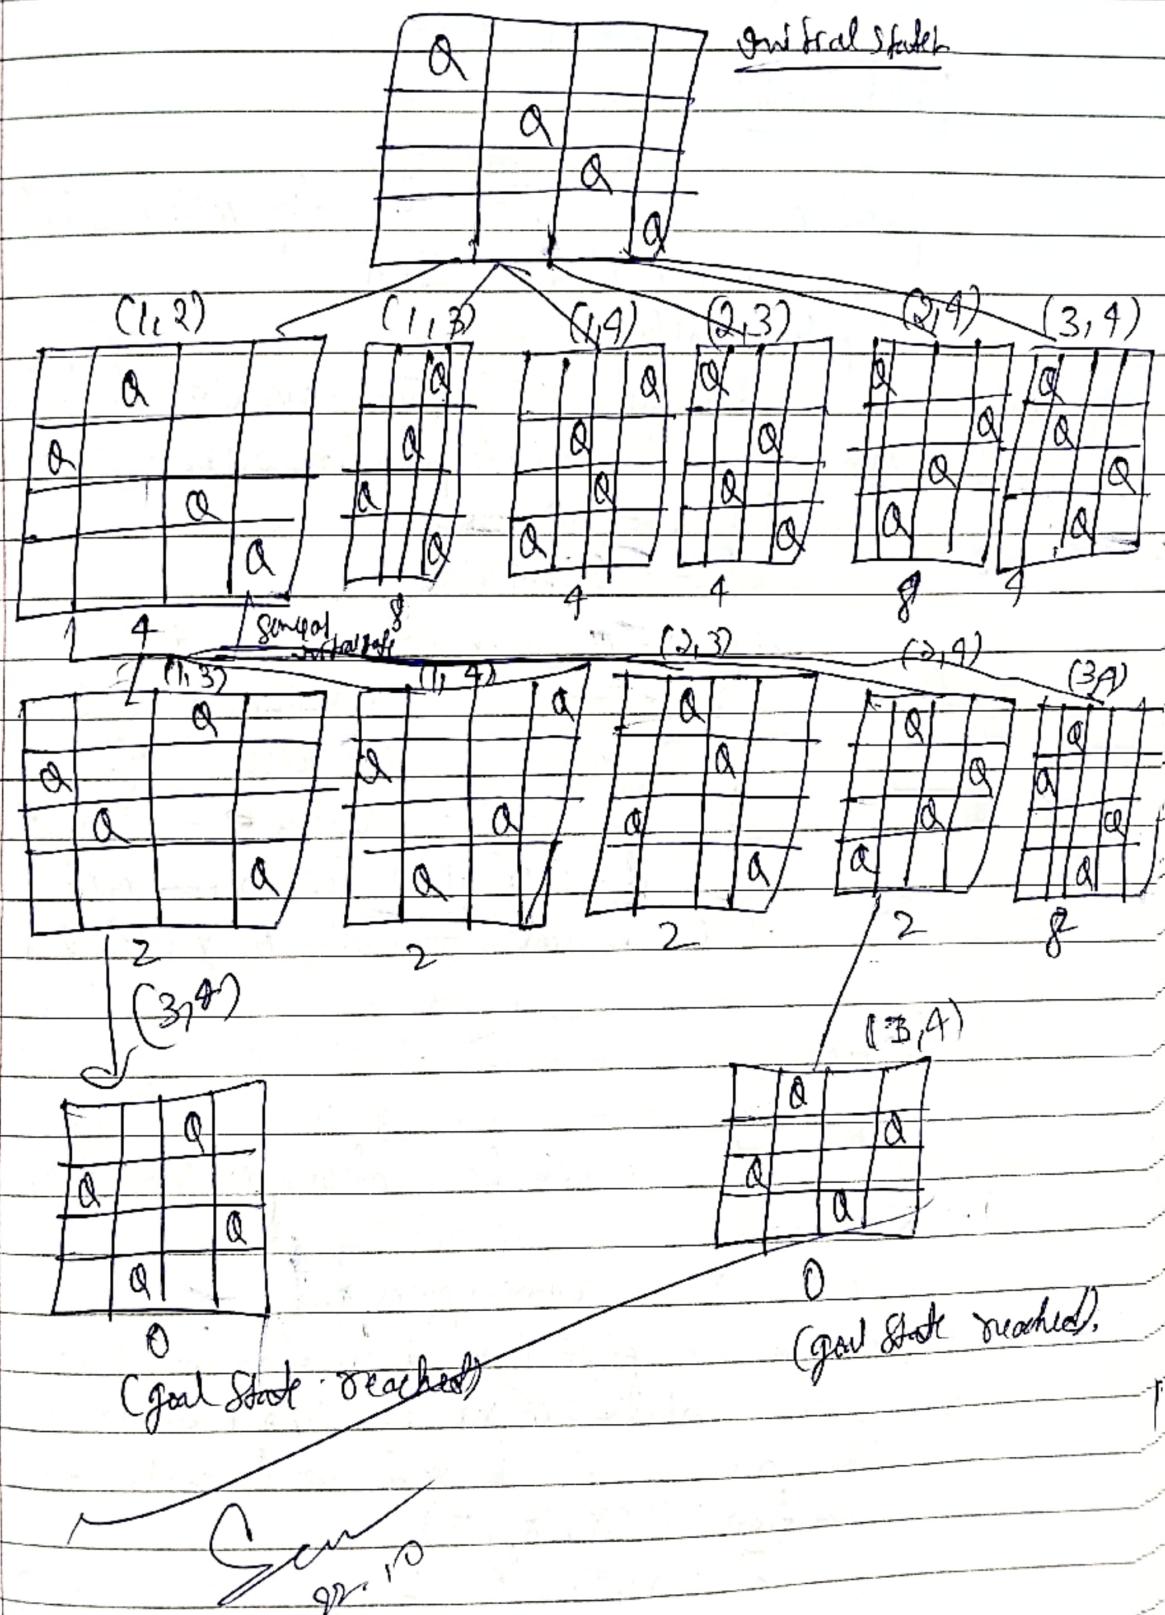

* Goal State: 4 queen on the board. No pair of queen are attacking each other.

* Neighbor relation

Swap the row positions of two queens.

* Cost function: The number of pairs of queen attacking each other, directly or indirectly.

State Space Tree

Write a program to implement Simulated Annealing Algorithm.

Pseudo code

function Simulated-Annealing(problem, Schedule) returns
a solution State

inputs: problem, a problem

Schedule, a mapping from time to "temperature"

current ← Make-Node(problem, Initial-State)

for $t = 1$ to ∞ -do

$T \leftarrow \text{Schedule}(t)$

if $T \geq 0$ then return current

next ← a randomly selected
successor of current

$\Delta E \leftarrow \text{next.Value} - \text{current.Value}$

if $\Delta E > 0$ then current ← next

else current ← next only with probability $e^{\frac{\Delta E}{T}}$

Algorithm

The algorithm can be decomposed in 4 simple steps

1. Start at a random point x_i .

2. Choose a new point x_j in a neighbourhood $N(x)$.

3. Decide whether or not to move to the new point x_j .

The decision will be made based on the probability function $P(x_i, x_j, T)$.

$$P(x_i, x_j, T) = \begin{cases} 1 & \text{if } f(x_j) \geq f(x_i) \\ e^{\frac{f(x_j) - f(x_i)}{T}} & \text{if } f(x_j) < f(x_i) \end{cases}$$

4. Reduce T .

1) Output & 8 Queen's problem

The first position found is [5 3 0 4 7 1 6 2]

The number of queens that are not attacking each other is 8.0

Chess board config uraffr.

Truth-table enumeration algorithm for deciding propositional entailment

A truth-table enumeration algorithm for deciding propositional entailment. (TT stands for truth-table). PL-TRUE? returns true if a sentence holds within a model. The variable model represents a partial model - an assignment to some of the symbols. The keyword "and" is used here as a logical operation on f/t two arguments, returning true (t) / false.

pseudo code for TT-ENTAILS function.

function TT-ENTAILS? (KB, d) return true or false.

Inputs: KB, the knowledge base, or sentence in propositional logic
d, the query, or sentence in propositional logic.

SymbolList ← a list of the proposition symbols in KB and d.

return TT-CHECK-ALL(KB, d, SymbolList, {})

pseudo code for TT-Check-All function:

function TT-CHECK-ALL(KB, d, SymbolList, model)

return true or false

if EMPTY? (SymbolList) then

if PL-TRUE? (KB, model) then return PL-TRUE? (d, model)

else return true // when KB is false always return true.

else do

$P \leftarrow \text{FIRST(Symbol)}$

$\text{rest} \leftarrow \text{REST(Symbol)}$

return $(\text{TT-CHECK-ALL}(KB, \alpha, \text{rest}, \text{model} \cup \{P = \text{true}\}))$
and

$\text{TT-CHECK-ALL}(KB, \alpha, \text{rest}, \text{model} \cup \{P = \text{false}\})$

Truth table

Propositional Inference: Enumeration method

example: $\alpha = A \vee B$ $KB = (A \vee C) \wedge (B \vee \neg C)$

Checking that $KB \models \alpha$

A	B	C	$A \vee C$	$B \vee \neg C$	KB	α
false	false	false	false	true	false	false
false	false	true	true	false	false	false
false	true	false	false	true	false	true
false	true	true	true	true	true	true
true	false	false	true	true	true	true
true	false	true	true	false	false	false
true	true	false	true	true	true	true
true	true	true	true	true	true	true

KB entails $\alpha \rightarrow \text{True}$

✓

ii/2⁴

Implement unification in FOL (First order logic).

Algorithm

Unify (Ψ_1, Ψ_2) :

Step 1: If Ψ_1 or Ψ_2 is variable or constant, then

- a) If Ψ_1 or Ψ_2 are Identical, then return NIL.

- b) Else if Ψ_1 is a variable,

and if Ψ_1 occurs in Ψ_2 , then return FAILURE

- b. Else return $f(\Psi_2/\Psi_1)$

- c) Else if Ψ_2 is a variable,

a. If Ψ_2 occur in Ψ_1 , then return FAILURE;

b. Else return $f(\Psi_1/\Psi_2)$,

- d) Else return FAILURE

Step 2: If the initial predicate symbol in Ψ_1 and Ψ_2 are not same, then return FAILURE.

Step 3: IF Ψ_1 and Ψ_2 have a different number of arguments, then return FAILURE.

Step 4: Set Substitution Set (SUBST) to NIL.

Step 5: For $i = 1$ to the number of elements in Ψ_1 .

a) Call unify function with the i th element of Ψ_1 and i th element of Ψ_2 and put the result into S ,

b) If $S = \text{failure}$ then return FAILURE.

c) If $S \neq \text{NIL}$ then do,

a. Apply S to the remainder of both L_1 and L_2

b. $SUBST = APPEND(S, SUBST)$.

Step 6: Return $SUBST$.

$$\text{Q}) P(x, F(y)) \rightarrow \textcircled{1}$$

$$P(a, F(g(u))) \rightarrow \textcircled{2}$$

$\textcircled{1}$ and $\textcircled{2}$ are identical if x is replaced with a in $\textcircled{1}$

$$P(a, F(y)) \rightarrow \textcircled{1}$$

$$P(a, F(g(u))) \rightarrow \textcircled{2}$$

y is replaced with $g(u)$ in $\textcircled{1}$

$$P(a, F(g(u))) \rightarrow \textcircled{1}$$

$$P(a, F(g(u))) \rightarrow \textcircled{2}$$

so finally both $\textcircled{1}$ & $\textcircled{2}$ are identical.

$$\text{Q}) Q(a, g(a, a), f(y)) \rightarrow \textcircled{1}$$

$$Q(a, g(f(b), a), x) \rightarrow \textcircled{2}$$

$\textcircled{1}$ & $\textcircled{2}$ are identical if a is replaced with $f(b)$.

$$Q(a, g(f(b), a), f(y)) \rightarrow \textcircled{1}$$

$$Q(a, g(f(b), a), x) \rightarrow \textcircled{2}$$

If $f(y)$ is replaced with x in $\textcircled{1}$

$$Q(a, g(f(b), a), x) \rightarrow \textcircled{1}$$

$$Q(a, g(f(b), a), x) \rightarrow \textcircled{2}$$

so finally both $\textcircled{1}$ & $\textcircled{2}$ are identical.

88

Create a Knowledge Base consisting of first order logic statements and prove the given query using forward reasoning.

A conceptually straightforward, but very inefficient, forward-chaining algorithm. On each iteration, it adds to KB all the atomic sentences that can be inferred in one step from the implication sentence and the atomic sentences already in KB. The function Standardize-Variable replaces all variables in its arguments with new ones that have not been used before.

Algorithm FOL-F(\neg Ask(KB, α)) return a substitution or false.

Input: KB , the knowledge base, a set of first-order definite clauses;
 α , the query, an atomic sentence.
 local variables: new , the new sentence
 inferred on each iteration.

repeat until new is empty:

new $\leftarrow \{ \}$

for each rule in KB , do

$(p_1 \wedge \dots \wedge p_n \Rightarrow q) \leftarrow \text{STANDARDIZE-VARIABLE}$
 (rule)

for each θ such that $\text{SUBST}(q, p_1 \wedge \dots \wedge p_n, \theta) = \text{SUBST}(q, p'_1 \wedge \dots \wedge p'_n, \theta)$

$\neg p_n \leftarrow \text{SUBST}(\theta, p_n)$

for some $p'_i \leftarrow p'_n$ in KB

$q' \leftarrow \text{SUBST}(\theta, q)$

if q' does not unify with some sentence already in KB or new then

add q' to new
 $\emptyset \rightarrow \text{UNIFY}(q', \alpha)$
 if \emptyset is not fail then return \emptyset
 add new to KB
 return false

example

It is a crime for an American to sell weapon to hostile nations. Let's say, $p, q,$ and r are variables.

$\text{American}(p) \wedge \text{Weapon}(q) \wedge \text{Sell}(p, q, r) \wedge \text{Hostile}(r) \Rightarrow \text{Criminal}(p)$

Country A has some missile

$\exists x \text{Count}(A, x) \wedge \text{Missile}(x).$

Existential instantiation introducing a new constant $T_1:$

$\text{Count}(A, T_1)$

$\text{Missile}(T_1)$

All of the missile were sold to country A by Robert

$\forall x \text{Missile}(x) \text{Count}(A, x) \Rightarrow \text{Sell}(\text{Robert}, x, A)$

Missile are weapon

Robert is an American

$\text{Missile} \Rightarrow \text{Weapon}$ American(Robert)

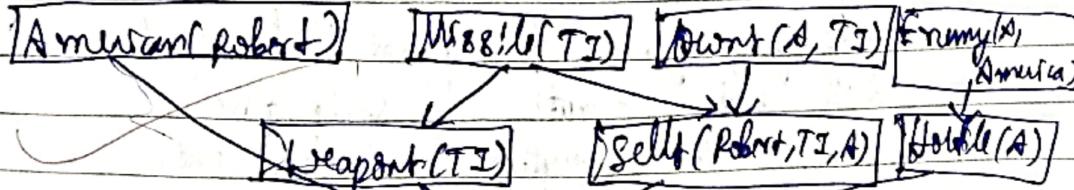

Enemy of America unknown at hostile. The country A, an

$\forall x \text{Enemy}(x, \text{America}) \Rightarrow \text{Hostile}(x)$

enemy of America

$\text{Enemy}(A, \text{America}).$

To Prove Robert is Criminal
 Criminal(Robert)

26) (ii) $\text{American}(p) \wedge \text{Weapon}(q) \wedge \text{Sell}(p, q, r) \wedge \text{Hostile}(r) \Rightarrow \text{Criminal}(p)$

Lab-8

Convert a given first order logic statement into ~~resolution~~.

A Buc steps for proving a conclusion S
Given premises Γ ————— problem.

1. Convert all Sentence to CNF.
2. Negate Conclusion S & Convert result to CNF.
3. Add negated Conclusion S to the premise clauses.
4. Repeat until contradiction or no progress is made
 - a. select 2 clauses (call them parent clause).
 - b. Resolve them together, performing all required Unification.
 - c. If resolution of the empty clause, a contradiction has been found. (i.e., S follows from the premise).
 - d. If not add resultant to the premise.

If we succeed in Step 4, we have proved the Conclusion.

proof by resolution

Given the KB or premise

John likes all kind of food.

Apple and Vegetable are food.

Anything anyone eats and not killed is food.

Anil eats peanuts and still alive.

Harry eats everything that Anil eats.

Anyone who is alive is neither not killed.

Anyone who is not killed is neither alive.

prove by resolution that

John likes peanuts.

Augmentation in FOL

- a. John likes all kind of food
- b. Apple and vegetables are food.
- c. Anything anyone eats and not killed is food.
- d. Aril eats peanut and still alive.
- e. Harry eats everything that Aril eats.
- f. Anyone who is alive is not yet killed.
- g. Anyone who is not killed is yet alive.
- h. John likes peanuts.
- i. Harry eats花生 (peanuts)
